This report is the result of the statutory mandate by the National Commission on Libraries and Information Science (NCLIS) to promote activities to extend the nation's library and information handling capability as essential links in the emerging global information infrastructure. In a study to inventory the challenges related to libraries' roles in the National Information Infrastructure (NII), it was discovered that libraries had difficulty identifying and describing specific Internet costs. The cost elements, models, and worksheets presented here are intended to serve as useful guides for public libraries and communities in planning Internet connections and services. Five representative connectivity models and seven broad cost categories are identified for use by public libraries planning Internet connectivity and services. The value of this study rests more with the development of cost models, worksheets, and cost categories than with the costs represented in this report. However, the representative costs illustrate the significant variations that are possible in planning the networking permutations and configuration available to the public library community. For example, an initial one-time cost of \$1,475 and a recurring annual cost of \$12,635, a public library can establish a minimal level of single-workstation, text-based Internet connection. A more sophisticated representative multimedia connectivity model is described involving multiple workstations at multiple locations for a one-time

cost of \$266,375 and a recurring annual cost of \$154,220, indicating the wide variation in cost and connectivity possibilities. The findings are intended to provide a basis for extending the benefits of advanced information services to the nation through its 9,050 public libraries. Models are illustrated through 14 figures. Two appendices provide research methodology and glossary of Internet terms. (Contains 14 references.) (Author/MAS) InfoWorld is targeted to Senior IT professionals. The acceptance of volunteered geographic information (VGI) as a valued and useful source of information for governments is growing at all levels. Put simply, VGI is “crowdsourced” geographic information provided by a wide range of participants with varying levels of education, knowledge and skills (see Michael Goodchild’s writing for the original definition of the term). While a growing body of research demonstrates the reliability and accuracy of VGI when compared to official or government produced data sets, the progression towards their adoption and wider use is slow. There are a range of mechanisms and methods available for ensuring that crowdsourced information is fit for purpose so concerns about data quality are not the major reason for the lack of adoption. Instead, organizational practices, regulations and legal issues limit the rate of change. This report is based on a six-month study of the use of VGI by government and aims to provide a guide for the successful implementation of VGI. PCMag.com is a leading authority on
